

GENERATOR REMOTE MONITORING SYSTEM

Why it's important

- Identify problems in advance, before a critical power outage
- Receive real-time notifications and check status from the convenience of your office, home, or travel
- Viewable by customer's desktop, tablet, and smartphone

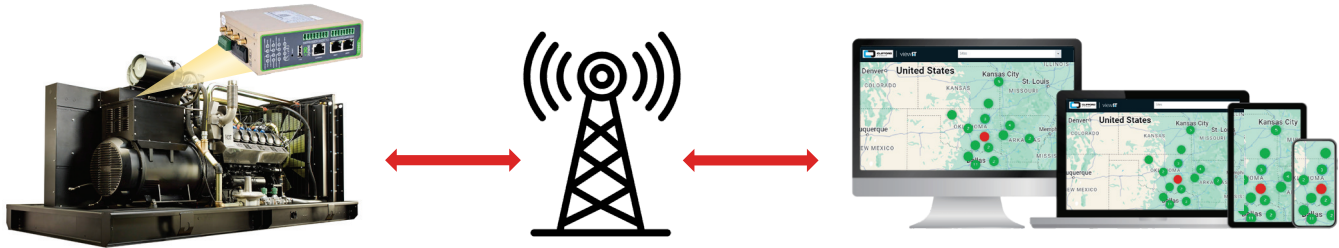

Ensure your generator is always ready for a power outage. When generators fail to start, it's often caused by a preventable issue such as a dead battery, lack of fuel, or a minor mechanical failure. Generator remote monitoring keeps you connected and informed, giving you peace of mind that your generator is prepared to power up when you need it.

- Wireless monitoring 24/7/365
- Works with all generator models
- Alarm notifications via email or text message
- Prevents 95% of fail-to-start situations
- Weekly/monthly activity and status reports
- Global cellular connectivity
- Secure web-based management
- Time/date stamped event logs
- Data archiving and export
- Allows for rapid service response

How it works

Once the monitor is installed on your generator, it will collect data 24/7 via cellular connection (or optional satellite). In the event of a problem, it will alert the appropriate party via email or text. Reports and status can also be viewed on your desktop, tablet, or smartphone.

Real-Time Alerts Prevent Equipment Failures

1. The monitor will send Generator Fault alerts to your designated points-of-contact via email or text.
2. Allows you to evaluate the generator status anytime, receive routine status reports, and remotely test-run the generator.
3. If the issue requires onsite service or repair, contact Clifford Power to request a Service Technician. We are available 24/7/365 at 1-800-324-0066. Standard service rates apply.

Remote Monitoring is Available for All Brands, Including:

KOHLER
GENERATORS

WOODWARD

DSE Genset®

ComAp▶

CAT®

DETROIT™

GENERAC™

Cummins

mtu

Basler Electric™
